HEALING POWER OF MANUKA HONEY

Honey has broad spectrum antibacterial properties and is used for wound debridement and decontamination.

Honey has been used successfully in acute wounds such as burns, surgical wounds, contaminated wounds, and traumatic wounds.

It has also been useful in non-healing wounds such as ulcerated wounds, dehisced surgical sites, antibiotic resistant wounds - including MRSA and other multi-drug resistant bacterial strains - and wounds with biofilm formation.

Honey has been used medicinally across diverse species: from humans to small animals, horses, birds, and farm animals.
