

PRE AND POST ORTHOPEDIC SURGERY CARE

4CYTE™
dog

Your dog is scheduled for an orthopaedic surgery and below are some important points for pre & post-surgical care.

PRE-OPERATIVE CARE

Your vet has recommended commencing daily oral administration of 4CYTE™ Epiitalis® Forte Dog prior to your dog's scheduled surgery.

4CYTE™ Epiitalis® Forte Dog reaches peak efficacy 7-14 days after beginning daily dosing. Therefore, starting treatment prior to surgery ensures supportive effects, such as inflammation reduction, has reached peak levels soon after surgery completion.

POST-OPERATIVE CARE

Your vet will discharge your dog following orthopaedic surgery with post-operative care instructions which includes daily supplementation with 4CYTE™ Epiitalis® Forte Dog.

Epiitalis®, Derived from a plant seed oil comprised of fatty acids, Epiitalis® is the world-exclusive active ingredient powering 4CYTE™. Epiitalis® is globally patented for its ability to help maintain healthy cartilage growth.

Injuries to cruciate ligaments or conditions such as elbow and hip dysplasia, are often associated with either existing osteoarthritis, or progress to the development of osteoarthritis. Following surgery your vet will have dispensed medications to treat pain and inflammation for the short term. However, daily supplementation of 4CYTE™ Epiitalis® Forte Dog is recommended to reduce the progression or risk of osteoarthritis developing.
